

Quality assurance for customized developments

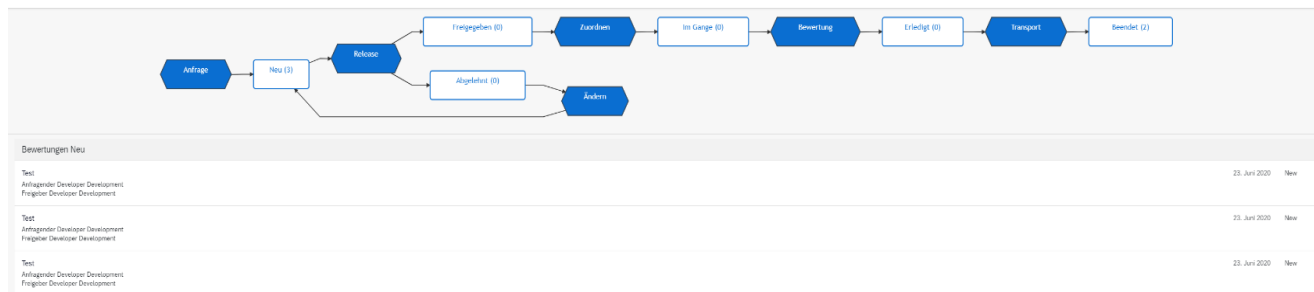

The problem

In almost every SAP system, adjustments to the SAP standard are necessary to implement business requirements. These take the form of enhancements and additional developments. Normally, a large set of company rules is available for the implementation, to which developers and external implementation partners must adhere. However, as a customer, you often do not know whether what is implemented complies with the company's specifications. The danger that deviations from the company standard will steadily increase is great. The resulting support effort increases.

The Solution

With CiancIT Source Code Review, company specifications can be reviewed efficiently and replicably. The intuitive user interface and integrated workflow process between developers and reviewers greatly facilitate collaboration. You decide which development objects should be reviewed and then find their way into production.

The Product | CSR - CiancIT Source Code Review

- Customized developments adhere to the set of rules for development defined by the customer
- Adaptations meet identical quality standards
- Automatic checks reduce the testing effort and save internal resources
- Findings can be processed & resolved by developers and reviewers together
